

Evidence Table — my-research_20260302_060614

- [S002::c00035] highlights the advantages of LLM approaches in business insights extraction, including adaptability to new patterns [S002::c00035], handling of unstructured data [S002::c00035], generation of more nuanced and contextually rich insights [S002::c00035], and reduced maintenance overhead [S002::c00035].

Evidence: 5.2 LLM Approaches to Business Insights Extraction LLM approaches to business insights extraction represent a shift towards leveraging advanced artificial intelligence to analyze and interpret data. Unlike rule-based systems, LLMs rely on p [S002::c00035]

- [S002::c00024] emphasizes the importance of a hybrid strategy combining precision and reliability of rule-based systems with contextual understanding and linguistic flexibility of LLMs.

Evidence: and LLM approaches offer significant merits in data processing and analysis, the most effective business insight generation pipelines employ a hybrid strategy. This combines the precision and reliability of rule-based systems with the conte [S002::c00024]

- [S002::c00031] suggests that leveraging LLMs to understand and generate code for data transformations can create a flexible and powerful tool to streamline data preprocessing workflows.

Evidence: Conclusion Building a data preprocessor via an LLM based on input and output dataset examples represents a novel approach to automating data preprocessing tasks. While promising, this method requires careful design, testing, and refinement [S002::c00031]

- [S002::c00050] demonstrates the synergy between LLMs and rule-based systems, enhancing the extraction and analysis of complex business data while addressing critical challenges faced by each method when applied independently.

Evidence: nable business intelligence. This paper has demonstrated that while each approach has its inherent strengths and weaknesses, their integration can harness the precision and reliability of rule-based systems alongside the dynamic and context [S002::c00050]
